

WP 130.22

Set of 4 bending and torsion specimens, Cu

Learning objectives/experiments

- with WP 130: multi-axial loading of specimens by combined torsion and bending
 - ▶ determination of the yield point
 - ▶ verification of the Rankine yield criterion
 - ▶ verification of the Tresca yield criterion

Specification

- [1] specimens for experiments on multi-axial stress states
- [2] 4 specimens made of copper
- [3] accessory for WP 130 Verification of stress hypotheses

Technical data

- 4 specimens, copper
- length: 49mm
- clamping length: 11,5mm
- clamping diameter: 12mm
- specimen diameter in measuring cross-section: 4,5mm
- cross-sectional area: 8,8mm²

Weight: approx. 100g

Scope of delivery

- 1 set of specimens (4 pieces)

Description

- **specimens made of copper to investigate bending and torsion loading on the WP 130 experimental unit**

This set of specimens is available as an accessory for the WP 130 experimental unit.

The experimental unit WP 130 is used to verify these comparative stress hypotheses on test specimens made of various metals. For the purpose, a multi-axial stress state is produced at a point on the specimen and the resulting deformation is measured. The specimens have a ring-shaped cross-section in the area loaded.

The ends of the specimens are appropriately reinforced for clamping to the WP 130.

The set contains four specimens made of copper (E-Cu).
